

may vary from 10 to 100 microns, depending on the material used. The release liner is typically made of a non-adhesive material, such as polyethylene or polypropylene, and is designed to be easily removed from the adhesive layer without damaging the adhesive. The release liner is typically used in applications where the adhesive is used to bond a material to a substrate, and the material needs to be removed from the substrate without damaging the substrate. The release liner is typically used in applications where the adhesive is used to bond a material to a substrate, and the material needs to be removed from the substrate without damaging the substrate.
